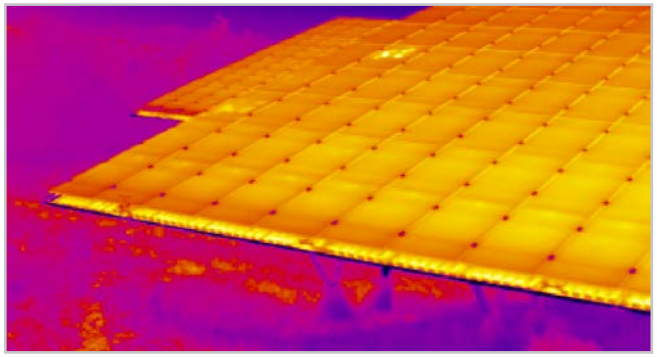
thermoIMAGER TIM - compact USB thermal imaging cameras for precise thermography

Non-contact measurements of temperature distribution using thermal imaging cameras enable to efficiently monitor and control temperature-critical processes in various fields of application. The thermoIMAGER infrared cameras are renowned for stationary thermography providing an excellent price/performance ratio. They are connected via USB 2.0 to a computer and promptly ready for use. The license-free TIMConnect software visualizes and records the detected temperature data as thermal images. Additionally, the software provides set up and configuration and enables to control the infrared cameras.

Functioning principle of Micro-Epsilon thermal imaging cameras

Thermal imaging cameras from Micro-Epsilon are designed to measure surface temperatures from -20 °C to 1900 °C. The infrared radiation emitted by a body is used for the measurement. As this measurement is a non-contact technology, the devices perform wear-free and can therefore be reliably used in the long term. Selectable models and optical systems enable to install the cameras in different distances from the surface. This allows for the target to be measured from a safe distance in critical applications.

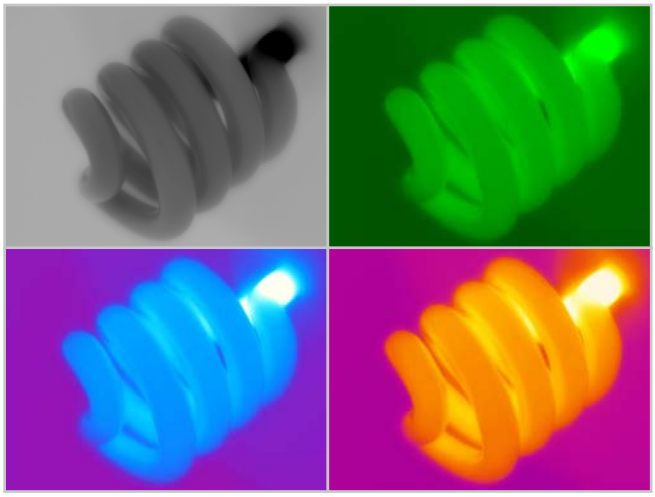


Fast temperature measurement even on large surfaces
Due to this non-contact technology, measurement objects can be detected precisely and wear-free. Large surfaces can be measured accurately at millisecond intervals. The camera can be operated in the line monitoring mode in order to continuously monitor the process.

Compact design for mobile and stationary use
The thermoIMAGER cameras close the previous gap between portable infrared snapshot cameras and devices for stationary use.
Exemplary fields of applications:
- Process automation
- Test stations
- Research & Development
- Mobile measurement tasks

License-free software
- Automatic process and quality control
- Individual alarm threshold settings depending on the respective process
- Analog and digital signal input
- External communication of software via COM ports, DLL and LabVIEW driver
- Compatible with Windows 7/10

Easy process integration via advanced interfaces
- USB cable extension up to 100 m (Ethernet)
- Process interface (PIF) as analog or digital input/output
- Serial data communication via RS232



Large temperature measuring range
Thermal imaging cameras from Micro-Epsilon are suitable for use across a wide measuring range - from low temperatures prevalent in cooling chains or laboratories, to the highest temperatures in metal processing applications.
